## Chapter 3. Testing XML and Database

In this chapter, we will cover the following recipes:

- Establishing and closing a database connection
- Using SQL queries programmatically
- Using a database checkpoint
- Using an XML checkpoint

### Introduction

This chapter provides some basic recipes to handle **Database (DB)** and **XML** testing within UFT.

It provides essential support for data connectivity to both external databases and **Extensible Markup Language (XML)** file formats with the function library.

This chapter does not detail the API test functionality that was recently introduced within Unified Functional Tester Version 12 as part of the integration with the Service Test product line, which provides native support and additional functionality around DB and XML within the Standard Activities Toolbox.
