## Creating a DataTable parameter

**DataTable** is a UFT object that acts as a wrapper to an MS Excel file and its scope is global. This means that it can be accessed from any action within a test, as well as from function libraries that were attached to the test. When you create a new test or open an existing UFT test you will notice that the **DataTable** pane will always show a global and local datasheet, one for each existing action within the test. In this section, we will see how to create a **DataTable** parameter.

### How to do it...

Perform the following steps to create the **DataTable** parameter **LocalParam1** for the local sheet:

1. From the **File** menu, navigate to **New | Test** or use the **Ctrl + N** shortcut. When a new test dialog opens, choose **GUI Test** and then click on the **Create** button.
2. We will create a **DataTable** parameter in the **Action1** local sheet from the UFT data pane by double-clicking on the column header and entering the parameter name **LocalParam1** in the dialog that opens, as shown in the following screenshot:

Similarly, for the test global sheet we will create a parameter named **GlobalParam1**.

3. Next, we need to enter our input data in the remaining cells of the parameter column in the global or local sheet, according to the requirements.

### How it works...

If we open the **Default.xls** file in the **test** folder (which, as its name suggests, is the default data source for a new test), we will notice that there are two worksheets, namely, **Global** and **Action1**. In each of these, the first row holds the name of the parameters, so we will see **GlobalParam1** in the **Global** worksheet and **LocalParam1** in the **Action1** worksheet. You will also notice that the used rows have borders at the bottom of the worksheet (the borders have no real function; UFT identifies the used range by the number of used rows and columns based on the content range).
